The efficient maintenance of equipment depends, to a large extent, on the speed with which you can identify and secure replacement parts. **P@rtner Electronic** is a program presenting the maintenance parts catalogue with full graphics and the ability to interface transparently with existing inventory and parts ordering systems.

P@rtner Electronic is a software package running on Windows. It provides maintenance personnel with a complete **electronic parts book**. **P@rtner Electronic** makes it easier to understand relationships between assemblies, sub-assemblies and parts, and allows users to navigate quickly and logically from one drawing or schematic to another. Components or assemblies can be located instantly, and displayed with their corresponding parts diagram.

The answer to your parts application problems !

Searches can be carried out by part number or key words in the part description. They can also be narrowed down to a specific vehicle by entering its serial number.

Built-in parts requisition module allows you to select the replacement parts required directly from P@RTner Electronic and order it using a standard e-mail function, linked to the software.

The Partner Electronic reduces downtime for coaches and cut down on errors in the parts ordering process.

Technical notes can be attached to any assembly. These notes can be scanned drawings or photographs, drawings imported from data files or any data file that can be associated with another Windows application such as word processing, spreadsheets, etc.

It is possible to attach text notes anywhere on the drawings. The notes are displayed in a different colour and can be turned on and off. P@RTner Electronic automatically attaches the user code and the current date to the annotation.

CatBase is a software developed by Novalog Inc. Established in 1989, its corporate mission is to design, develop and market software tools that facilitate access to technical documents required for the operation and maintenance of machines and equipment.
